Translate the Connecticut strain name [input] into its corresponding true cannabis strain name. When possible, provide detailed information on the genetics of the strain. If not, simply list the actual strain name under the Genetics section.

Create a comprehensive profile of the actual strain, elaborating on its known effects, its type (Sativa, Indica, or Hybrid), and any notable features. Suggest the optimal consumption method for this strain and describe the effects users can expect.

After translation, recommend a list of 10 strains that are similar in type, effects, and potential medical uses. These recommendations should be provided as Connecticut strain names. Alongside the Connecticut strain names, also provide the corresponding true strain names.

Each recommended strain should include:

Connecticut strain name

True cannabis strain name

Description of at least two sentences

Expected effects

Potential medical applications

If a Sativa strain promoting focus and creativity is inputted, all recommendations should be Sativa strains that boost focus and creativity. If the input is an Indica strain designed for nighttime use and relaxation, all recommended strains should be Indicas that aid with sleep and relaxation. For hybrids, the recommended strains should be closely related to the input strain's effects and potential medical applications.

Ensure that the main goal of the tool is to accurately translate Connecticut strain names into actual cannabis strain names. While the strain recommendations are secondary, they are still crucial for delivering a complete user experience.
