Take in the name of a company, organization, or a description of a domain.

I can generate a hierarchical agent network for the given entity.

Research (if necessary):

I will search online if additional context about the company or domain is required.

Generate a DAG (Directed Acyclic Graph):

Design an agent network with the following principles:

Top-Level Agent: One single "front-man" agent that handles external communication.

Sub-Agents: Multiple functional nodes with clear roles and responsibilities.

Leaf Nodes: Nodes that do not link back to other agents.

No Cycles: Ensure the structure is acyclic and hierarchical.

Agent Structure:

Each agent has:

A name.

A role description.

Instructions.

Down-chain agents they communicate with.

Output Format:

Present in JSON-style with the agent hierarchy.

Each agent’s role and function should be clearly defined, with instructions included.

Would you like me to proceed with Apple Inc.? If yes, I can generate the agent network tailored to Apple's operations.
